

The 7 – Year Program

For Child & Parent

TOTAL INVESTMENT: BASED ON SCHOLARSHIP TEST (UPTO 46 L.)

AGE: 7 – 14 yrs.

At this age, children often start answering back and learn to question authority.

This is also when they need to start following a specific curriculum of studying which suddenly makes studying boring for many children. So, they often start running away from sitting down to study and the constant nagging starts between the parent and child.

Eventually, their curiosity slowly starts losing, as their questions become more complex and they become more conscious about themselves.

The behavioral changes you will notice:

- Talk back
 - Temper Tantrums
 - Question Authority
 - Doesn't sit to study
 - Need to know everything
 - Rebellious, fighting with everyone.
 - Constant nagging between parents and children.
-

How do we work?

- Once a routine is established, slowly we move towards focusing on building strong foundation of concepts at this age, so they do not have to revisit topics repeatedly.
- We have observed that children in their later years often struggle with basics which then hinder in keeping up with the heavy syllabus.
- Then from this age we teach them 'thought experiments' which expand their imagination and build creative thinking so they can invest their remaining time in imagining, creating, and innovating.
- Creating gives them a medium to channelize their energy and curiosity. This not only helps them avoid distraction but also introduces them to their inner world of thoughts and ideas.
- This is the age when children have maximum energy and this is where we teach them how to sit with boring stuff and make it interesting for themselves. When they work on different

things, sit with problems, and re do steps to understand the problems, it instills the skill of becoming resilient.

- As they are in the age where learning is the major goal and have the time and space to try and fail, they learn to understand that failure is a part of learning something new. They learn how to deal with failure and do not fear retakes. This builds their skillset to approach life with compassion towards themselves rather than judging or criticizing themselves for not knowing something or not being perfect on the first try.
- This is also the age when the questions in their heads approach new heights, being curious about every little thing.
A very common pattern seen here is, whatever will be hidden from the child, they will want to know it more. Their questions can reach till questioning life, death and beyond. We can safely say this is where the existential questions start arriving for a human.
- This is why we conduct 'sit with self' sessions apart from their classes on daily basis where children learn to listen to their inner voice and to drown out the external noise. This helps them build a sense of self and this is when they start finding the answers to who they are.
- This shows them their capabilities, the areas they need to work on, to peel away the default societal conditioning and recognize the patterns they have slowly started building. They also find answers within themselves just from starting to understand their feelings. During adolescent years, they go through hormonal changes. So, it becomes important for a child to practice 'sit with self' and understand what is going on with their bodies, how life and death work, and sit with the bigger questions that are coming to them instead of running away or finding distractions to avoid them.
This will create a sense of calm in them when they become adults and teach them how to sit with difficult thoughts and problems.
- This not only stops there, as their brain is developing, they get irritated and need more time to themselves. Parents often confuse it with dissociating, but this is when the child is experiencing strong emotions and complex thoughts which is why we help them build processes that can make this thought process easier and less overwhelming.
- Everything the child is experiencing in themselves; we show them that their answers lie within their academic curriculum. From adolescence to existential questions, we show them how they can find the true depth of their questions in academics.
Now, according to the questions they start looking for, often determines their field of choice or say subjects of choice, degree of choice, etc. They will surely identify it and there will be no confusion in future when the time comes to look for a career path.
- At this age, children like to be more alone but since they are unable to communicate and do not understand the changes they are experiencing, they often start feeling lonely. At

this age, the child needs to be alone as much as they can be but as a community it is our responsibility to not let them feel lonely.

- These are two different concepts: one can do wonders and other pushes them towards loneliness. This is exactly when children learn to either fit in or dissociate themselves.
- This is why our goal is to help them build their individuality so that they do not feel the need to fit in or dissociate but rather know how to search for answers to their questions. This is where problem solving is introduced.
- This is where they self-explore, pursue different hobbies, experiment a lot of things and understand the basics of different skillsets like coding, robotics, graphic design, gaming, modelling, art etc. with us.
- Exploring hobbies isn't enough if they don't know the real cost of it. Hobbies are expensive, they cost money, so it is our responsibility to teach them value of it. This will come as a part of financial literacy we provide with regular classes.
- Financial literacy doesn't end with teaching budgeting and how money works in world market. Most of it starts with economics, civics and history. As they will learn, how money is directly related to values we humans generate. And how many people have sacrificed themselves in past to make that value reach every citizen as money.
- They will not only learn to value money but will also be able to understand and figure out on their own; the changes they will see in tax system and investment strategies throughout their lifetime.
- Learning with us is not about learning the present world. It is about being able to adapt and understand the changing world. Understand what changes are right and wrong for a common citizen and speaking up against the injustice and find out their own path to solve it and staying safe.

Academic skills acquired:

- Financial Literacy
- Learning Agility as a skillset.
- Able to structure their thoughts on paper.
- Able to put their thoughts and feelings into words.
- Understanding why they should study each subject.
- Having basic curiosity and knowledge in each subject.
- Identifying the problem they are having in each subject.
- Having a supportive nature to help other students facing academic problems.

What is your role in this as a parent?

- In this age, we recommend parents to assign them responsibilities and allow them to make mistakes but also hold them accountable instead of blaming or scolding them. Sentences like ‘you can’t do one thing right’ or ‘you are good for nothing’ build low self-esteem rather than teaching them to learn and improve.
- It is very important for parents to give them time and space to learn and understand how to be themselves and this is why being patient during this time solves most of the conflicts instead of taking things personally.
- They tend to become more isolated, and often forcing them to be in spaces they are not comfortable being, among people they do not want to be with, backfires. It’s okay to leave them be but it is also necessary to be available for them whenever they come out of isolation, even for a little time. We need to leave them alone but do not make them feel lonely because if we do, they will listen to someone who will tell them “You are not alone” before us.
- As they are in the process of figuring out a lot of things, you will also need to trust the process and learn how to respect their choices. Being direct, clear in your instructions instead of constantly nagging will help you build a better relationship with them in the long term.
- The goal is to help parents and children to be able to make time for each other just to connect in a space where parents do not worry about the child’s future and the child does not think that the parent will ask them to study as soon as they see them.

What will you see?

- Empathy
- A stronger sense of identity.
- Clarity on concepts, and skillsets, and the problems and questions they worked on with us.
