Note for Parents

Dear Parents,

Before you move forward, read through this to determine if we are the right fit for you.

Curious Team Learning is a company based in Kota, Rajasthan, where every year we see many children lose their lives to academic pressure. To understand and solve this problem, we observed and worked with children for almost a decade.

Our conclusions are drawn from different age groups, gender, cities, economic, and cultural backgrounds, and culminates years of real life & lived experiences.

I. Societal factors

1. Gender bias:

Children are often stereotyped based on gender.

For example, a girl struggling with math is frequently written off as a gender norm. Meanwhile, empathetic boys who do not practice toxic masculinity are often treated differently and bullied.

As a result, they either try to fit in and lose their identity, or they become shy, underconfident, and suffer from low self-esteem.

2. Privileged Background:

Most of us view privileged children as being 'sorted for life,' but to the kids, their path isn't sorted, its 'pre-decided'.

Being stripped of autonomy before they are even born, is suffocating.
This deep frustration often surfaces as tantrums or a 'spoilt' attitude, which adults quickly dismiss as ‘being ungrateful’.

In reality, these children are acting out against having no say in choices and decision making. Their future is already mapped out, so they lose the drive to learn, overcome academic challenges, or explore their own potential in the classroom.

Growing up in a vacuum & fighting for a single independent choice often results in them failing to develop real-world resilience, leaving them unable to navigate everyday struggles or form genuine, empathetic relationships beyond transactional needs.

© Curious Team Learning Pvt. Ltd.

II. Emotional Factors

1. Loneliness:

Studying is a lonely process.

A child cannot truly learn if they feel disconnected from their surroundings.
We observed every single child has the capacity to learn and succeed. The ones who struggle aren't lacking ability; they are simply feeling lonely.
Just as you cannot focus on work when you are starving, a child cannot focus on studying when they feel isolated. Many children genuinely want to study, but find it impossible to focus. They are overwhelmed by their thoughts, which they feel no one would understand while simultaneously learning to navigate their academic journey.
This restricts them from making space to be curious or to learn something new.

2. Perfectionism & Fear of Failure

Children often sat frozen and stared absentmindedly when they came across a new set of problems or completely avoided starting to work on them.

They feared the messy and uncertain process of figuring things out. They expected themselves to know it all before their first try and avoided to sit through the discomfort of learning and exploring.

The consequence of it isn't just seen in their academic learning journey but also in their life decisions, as they grow older. For them, the safest option becomes not trying or not making one at all.

3. Financial Pressure:

Many children carry the emotional weight of their parents' financial sacrifices.

This creates a high-pressure environment where students are forced to chase perfect grades and study for endless hours, while teachers are pressured to constantly give extra time.

Instead of fostering a love for learning, this dynamic creates burnout for both the child and the educator.

4. Parental Pressure:

When parents equate productivity with academic success, it leads to nagging.

This creates conflicts that severely damages a child's ability to learn. Instead of focusing and being present, students spend study sessions consumed by stress and anxiety, resulting in short attention spans, chronic procrastination, and studying as a chore rather than a choice.

5. Parental Expectations:

When a child's life is spent performing for a metrics and their future is planned from start to finish, it takes away the process of learning, growing and understanding of how to navigate life. A perfect & planned life is just anxiety, doubts and expectations masquerading as concern.

© Curious Team Learning Pvt. Ltd.

Most parents measure a child's overall growth solely through their grades, but marks fail to tell the full story.

A low grade reflects a test result, not a child's potential, creativity, or character. Development encompasses emotional, social, and creative dimensions that must be evaluated. So, to truly measure a child's progress, we need to look beyond academic metrics before jumping to a final conclusion.

6. Comparison & Competition

Children deeply internalize even the smallest comments their parents make.

In traditional classrooms, we noticed children constantly struggling to keep up with their peers. They are completely oblivious to the invisible factors like varying privileges, home environments, and resources that shape the majority of the child's academic journey.
So, all they focused on was why someone else could perform well when they couldn't.

This relentless focus on marks and comparison forced children into an unhealthy competition, completely distracting them from their own unique learning and growth.

III. Biological differences

1. Health:

Many children are naturally more sensitive than others and simply do not fit into society's definition of 'normal.' They process their surroundings differently, absorbing the stress and sensory overload of their environment like a sponge.

This constant internal strain often manifests physically, causing them to fall sick repeatedly and slowing down their overall pace of learning and growth.

2. Thinking:

Not all children think in words, many also think in pictures.
They process thoughts differently.

While many express themselves easily through spoken or written words, others struggle because they think in pictures and visual concepts.
This difference in cognitive processing does not mean a child lacks intelligence/ capability. Neither is falling behind but rather, it shapes how they communicate.

This affects the time they need to formulate their internal visuals into coherent thoughts.

3. Self – expression:

A child's mode of self-expression isn't as simple as it appears on the surface.

Even when children seem to communicate in the same way, their internal processing is entirely unique. This is why they need time and non-judgmental space to experiment, explore, and discover what truly allows them to express themselves.

© Curious Team Learning Pvt. Ltd.

4. Time they are productive:

Every child operates on a unique biological clock.

The mental alertness, core motivators, and individual approaches to learning vary for each child. Taking these natural rhythms into consideration is essential to unlock a child's true potential.

© Curious Team Learning Pvt. Ltd.

IV. Learning Environment

- We observed that learning environments like schools, coaching centers are overcrowded and over stimulating for many children, adding nothing to their growth and learning.
- Most children who studied with us after school were severely exhausted, burnout and struggled to put effort into learning or being curious.
  Rigid, compliance-based and one size fits all approach, often wastes the time of the child who wants to ask questions, learn & understand more about the topic.
- As they are used to mindless instructive learning, staying mentally present during the classes seemed to be a struggle for them.
  This resulted in educators revisiting the same basic problem repeatedly with little to no meaningful progress or significant change. This ended up wasting the child's and educator's time.
- When a child struggles in school, parents add extra coaching or tutoring but the root problem wasn't the child's ability, it's the rigid educational system that forces unique, creative minds into one-size-fits-all approach to chase syllabus and exams instead of focusing on their growth or understanding it.
- Children spent most of their time in finishing homework given in schools & coachings which added to the stress and took away their time for self-study and energy to be curious.
  Then introduction of AI, gave them the opportunity to save time with no mental effort. This makes doing homework pointless and adds nothing to their growth and learning.
- After a hectic day of school then coaching and homework, children were completely drained and struggled to focus. When this cycle continues year after year, it slowly destroys their curiosity, which turns reading and writing into a chore.
- Many parents believe that a high pressured, competitive, learning environment will push their child to do better.
  In reality, it causes severe stress, leaving children exhausted from constantly trying to "catch up" to their peers. And the few students who do excel in these systems aren't succeeding because of the pressure. They succeed because of their ability to tune out the noise and focus entirely on their own learning instead of the competition.
  So, this high-stress system isn't driving their success, it is simply taking the credit for it.

© Curious Team Learning Pvt. Ltd.

V. Consequences of Education

In many traditional households, core outcomes of education such as questioning authority, open communication, and confidence in one's individuality are viewed as direct threats to the status quo.
When children learnt to set boundaries, to say 'no' to toxic dynamics, and make independent choices, their personal growth was labeled as ‘disrespect’.

If these factors are challenging for you to accept, we might not be the place for you.

Though if you still wish to consider us, let’s see how we are solving these problems:

1. With CuTe Learning, we are bringing back the concept that it truly takes a village to raise a child.
   We are building an environment that supports children & parents to navigate childhoods along with giving them a worry - free academic learning journey.
   Here, our goal is not to just share knowledge but to be a space that listens, understands & build an ecosystem where parents, children & teachers connect to achieve the same goal as a team i.e., support children in their growth.
2. Complete personalized online homeschooling provides children with a safe learning environment and gives them the freedom to experience and engage with the real world to the fullest because learning doesn’t happen in a vacuum.
   Additionally giving you and your child peaceful & a tantrum free learning journey.
3. We are a child-centric company.
   Here, the **time** of class, **what** they want to study, **till when** they want to study, and pace are decided by the child themselves giving them the control of their learning.
4. We follow ‘Listen – First Approach’. We believe that even though information can be imparted to hundreds and thousands at once, but you can listen to only one person at a time to understand them and be able to solve their problems.
   This is why are our classes are completely 1:1 & personalized, i.e., one teacher, works as a companion for one child at a time.
5. Our classes take up only up to 3 hours of their day. This gives them time and space to fill their day with things they like doing rather than being occupied with ‘studies’.
   Not only is this relaxing for the child but also gives both parents and children a stress-free academic learning journey.
6. We do not say, “The child can do better,” or “Has performed well”.
   We show exactly where they can and work with them on the problems, which enables them to do better.
   Our report system shows you each problem that the child has worked on with the educator. This documents each child’s learning path and overall growth that needed to be worked upon rather than one single metric.
   This builds an evidence of their journey, and the efforts they have put in.

© Curious Team Learning Pvt. Ltd.

7. Our learning process is built around the knowledge of children copying homework with internet & AI. Our teachers ensure that it is acknowledged and accepted, but at the same time question about their input.
   Our goal with this is to ensure that the child is educated about the topic and is able to answer on their own without criticizing them about copying but asking what value they have put in the answer.
   This prepares them for the world that says, “If we wanted an answer like this, we could have asked the AI ourselves. Why do we need you?” This teaches the child to lean into their value and what they can offer.

How does it solve the problem?

- Most children avoid studying because they are forced to do it.
  This is why giving them choices between subjects to be studied at the time gives them a sense of control over their learning journey and helps them to be more present.
- Through our 1:1 classes, our goal is to teach the child how to be present rather than practicing mindless instructive learning. So, our classes are curiosity and question led. The more questions the child asks, the better the class becomes. Questioning helps the child learn how to listen actively and attentively, building better listening skills.
- Our learning environment expands with the child’s learning.
  Even though we follow the academic curriculum we do not rush them to fit their curiosity and learning needs according to the environment but rather enable them to take up space.
- This also helps the child in retaining what they have learnt for long term i.e., once they study and understand in class, it removes the unnecessary need to study for endless hours. Once done is done.
  This builds strong foundation and confidence in what they have studied and learnt so they can practice it in their real life.
- In our classes, when a child faces or comes across a problem, the educator’s responsibility is to go down to the knowledge level of the child.
  From there, they use their experience to guide the child through the problem towards the solution. This creates a companionship rather than the perception that the teacher is a know-it-all. Building the sense of how each problem can be worked upon rather than getting a direct solution.
- Our classes do not give equal time to each subject but rather the time gets distributed based on the child’s requirement.
  For example, one child faces more problems in math while other faces in social science. So, our educators distribute the class time according to which subject needs more attention and then once the foundation is built in all subjects equally, then from there on, the time can be distributed equally.
- Our ‘sit with self’ sessions focus on building a child’s individuality and how to become comfortable within themselves.

© Curious Team Learning Pvt. Ltd.

Here, they learn how to sit with their thoughts, ideas and inner voice.
Through these they learn how to build healthier and better friendships and relationships with themselves and others, on their own terms, rather than tolerating or fitting into an environment that does not value or respect them.
This also teaches them to define their self-worth, become self-aware and rooted in self, saving them from getting exploited in workplaces, and tolerating toxic work-cultures in future.

- Our regular collaborative learning session teaches children to be in a non-judgmental, safe space with other children of same or different age groups, different backgrounds where they learn and collaborate with each other to work, build, create and study.
  This not only helps them build leadership and communication skills but also shows what learning & growing around healthy and safe people looks like.
- With CuTe Learning, our end goal is to help children create a healthier relationship with learning, academics and themselves.
- Current traditional education system forces parents to choose between structured academic learning and their child's needs & well-being, often leaving them with guilt of unable to prioritize their child over the system.
  Whereas, our system bridges this gap and becomes a seamless, effortless solution where the parents don't have to make this harsh choice.
  Here, they can prioritize a structured, disciplined, consistent learning along with their child's needs and well-being.

This is why, we are saying no to the toxicity and unhealthy learning environment that children have been provided with till now. Neither we put the child through a high pressuring nor competitive atmosphere and follow strict policies towards misogyny, toxicity & inappropriate behavior.

NOTE:

Comparison & competition among children at any age is unacceptable.
According to our company policy, we take strict action towards it as for us a child's life is more important than creating false reputation.

© Curious Team Learning Pvt. Ltd.

What is your role as a Parent?

- Our work is not to replace your role as a parent but rather to give you the support system so you can focus on being a parent.
- We believe that when you will have less on your plate to worry about, then you can build a healthy relationship with your child.
- The work we put in is for your child and you to have a worry-free academic learning journey; and we encourage you to maintain it at home by providing a safe and healthy environment for them.
- We believe that the child's first learning environment is their home, and that they imitate the behavior and habits they see at home. This is why it is important for you as parents to show them the behavior you wish to see in them.
- We urge you to help us build better and healthier learning environment for your child by holding us accountable in areas that need to be worked upon. We are humans and in need of constant improvement, let's come together to help children understand the same.
- We understand your conflict of having to make the difficult choice of following the system over prioritizing your child's needs but now you have the chance to choose both, i.e., a safe, better academic learning environment & your child's needs. And the decision is yours to make.

If you've been looking for an environment & a support system that truly gets your child, then we are the place for you.

Children only get one childhood, and traditional system is designed to take away their curiosity before they even get a chance to discover who they are.
And staying in their current environment will eventually make them lose themselves.

Choosing this path means choosing your child's curiosity, individuality and themselves while there is still time to protect their love for learning.

And we are here for you, if you are willing to make the change.

Children love learning with us, which our observation proves, but many miss out because adults hesitate to step away from the norm.
And if you ever question the investment, just step into the educator's shoes and ask:
'Can you dedicate & sustain your entire livelihood for 7 LPA in this economy?'

~ Disha Audichya

Stages of Curious Team Learning Plan

We at Curious Team Learning divide the learning of a child into 3 programs:

Want to know more?

The description of each program plan based on age groups is given below.

© Curious Team Learning Pvt. Ltd.

The 2 – Year Program

For Child & Parent

TOTAL INVESTMENT: ₹7,04,411.00 PER ANNUM.

AGE: 4 – 6 yrs.

At this age, children love to be with parents and enjoy real life. They do not like to fit into rigid rules and schedules and because of it we see increased tantrums in them.

They also have a high sense of curiosity and ask a lot of questions. This often frustrates the already exhausted parents so either they deflect them or distract them. This suppresses the child's curiosity and often makes them feel that their questions are unimportant.

This creates an unhealthy relationship towards the studying time and eventually children start avoiding it.

The following behavior may develop:

- Acting like other kids.
- Crying more frequently.
- Being headstrong about something.
- Bored all the time and constantly wanting to do something.
- Taking choices in eating & other things which feel in their control.

How do we work?

- Current traditional system forces parents to wake up their child early. This disturbs children's natural rhythm of waking up and listening to their body need. This takes away the important time needed for their growth.
  This is why our classes are held according to the child's waking up schedule, they get proper sleep, so they are fully recharged, active and willing to engage.
- As there is no fixed curriculum for children at this age.
  So, our goal is to build healthier study routine in their daily life and satiate their curiosity. This also gives them a good amount of time to experience and explore.
- Then in our classes, the educators build a connection with the child by listening to what they observe, perceive and are keen on speaking about.
- Since they ask a lot of questions, we teach them how to slowly process and label it. Then slowly work to inculcate academics into their existing world view, i.e., teaching them through their surroundings, what they already observe and expand their observational skills.
- When they build a sense of security that their questions will be answered, they get calmer and get more open to listening.

© Curious Team Learning Pvt. Ltd.

- We intentionally do not answer them immediately as it helps them build patience.
  At this age kids get bored easily and do not know what to do the moment they sit idle which often results in more screen time.
  So, by letting them sit with their boredom and their questions, they passively learn how to patiently find real solutions on their own. Through this we teach them that boredom is simply the space where creativity begins. As 'sitting with self' patiently is a skill that even most adults struggle with.
- Our goal is not to just answer their questions filled with curiosity but also to show them the proof that their academic books hold answers to almost every question they can think of. This creates a keen interest in reading academic books out of curiosity rather than when forced. This reading habit will take them far in life.
- Our gamified experiences focus on their writing skills and slowly they learn to become independent in drawing, writing and speaking skills.
- This establishes no tantrums, learning and studying schedule for the child.
  This also teaches them to listen to their inner voice and how to create their life around it.
- They become clearer in communicating with their needs and build an understanding of how to live with others.
- They learn to hold their questions with patience, figure out themselves and how to look for the answers without troubling anyone.

Academic skills acquired:

- Navigate the child's need to be independent.
- Build independence in basic reading, writing and speaking skills.
- Building their world view and understanding the problems they face.
- Build Pattern Recognition as a strong skillset which helps the child in their adulthood.

What is your role as a parent?

- We recommend you to involve the children more into household chores and not to suppress their need to feel independent.
- The choices they take are crucial in this age. We understand your need as a parent to tell your child to eat healthy and do the right things, but this can easily build a sense of distrust in themselves and develop a mindset that their choices won't be heard.
  Make sure to first listen and then provide reason for your choice with patience and give them time to accept it.
- Children often copy others behavior, because when a person doesn't know what to do, they do what everyone else is doing. Adults do too but now we just know more things to

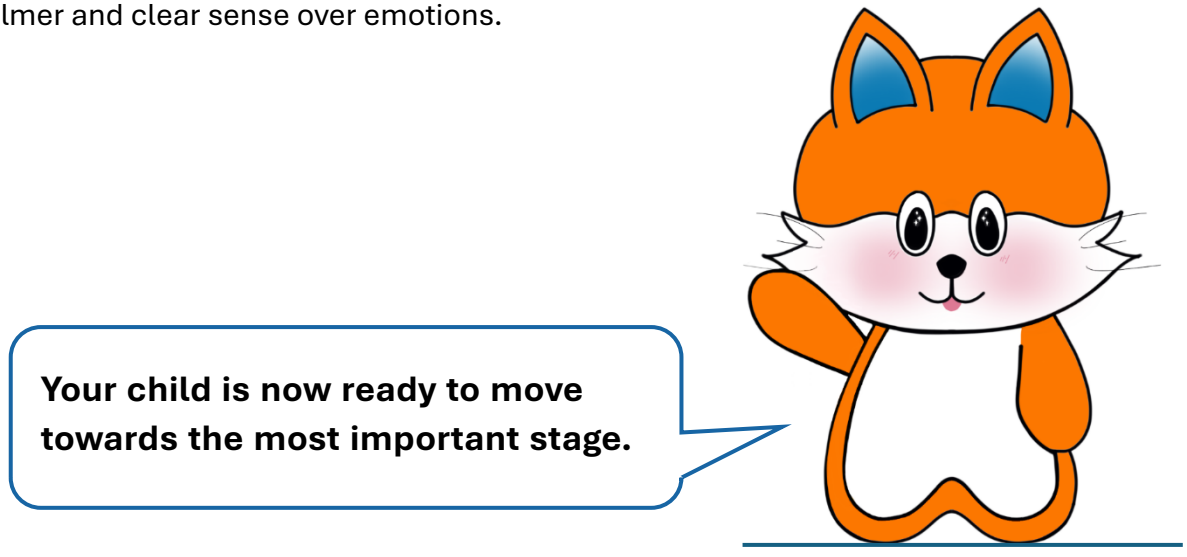

© Curious Team Learning Pvt. Ltd.

do, but a child doesn't.
So, it is only at this age they will copy everyone and then will learn to filter with time which behavior they want to keep and which they don't. Make sure you walk them through appropriate reasoning and help them figure out. Here, the more they will experience things themselves, the more they will learn what aligns with them. This helps them build their identity and sense of self.

- We ensure that parents don't have to bear the burden to dedicate extra time to teaching because they are tired, exhausted from working, be it office or household chores.
  We recommend parents to talk to their children. It can be about sharing about your day or letting them know you are tired and want to rest. This shows children that parents have a life happening in the outside world. They can feel sad for a bit, but you do not have to show that you are happy or energetic all the time. What you can do is let them know that you will dedicate a specific time or a specific day to them.
  This will reduce a ton of anxiety in them in their life ahead.
- This creates a better relationship when the parents don't have to manage tantrums just to make the child study or sit quietly and neither will have to make the harsh choice of forcing their child to read & write.
- You can utilize this freed-up time to take them to parks, walks, or play with them, i.e., taking care of their physical movement & what they eat during the day, instilling slow, screen-free eating habits.

What changes will you see?

- Reduced temper tantrums.
- High sense of engagement.
- Patience & understanding of others.
- Being confident in speaking to others.
- Calmer and clear sense over emotions.

© Curious Team Learning Pvt. Ltd.

The 7 – Year Program

For Child & Parent

TOTAL INVESTMENT: ₹7,04,411.00 PER ANNUM.

AGE: 7 – 14 yrs.

At this age, children often start answering back and learn to question authority.

This is also when they need to start following a specific curriculum of studying which suddenly makes studying boring for many children. So, they often start running away from sitting down to study and the constant nagging starts between the parent and child.

Eventually, their curiosity slowly starts disappearing, they retreat within themselves, and tend to isolate themselves as their questions become more complex and they become more conscious about themselves.

This increases their need for distraction, which results in increased use of phone, gaming etc. and avoids harder tasks that make them put in an effort.

The behavioral changes you will notice:

- Talk back.
- Question authority.
- Doesn't sit to study.
- Isolating themselves.
- Need to know everything.
- Rebellious, fighting with everyone.
- Increased use of phones, gaming etc.
- Passive aggressive during communications.
- Constant nagging between parents and children.
- You, as a parent, have to repeat tasks and chores repeatedly.

How do we work?

[Age Group: 7 – 11] – Understanding World through Academics

- Once a routine is established in the smaller ages, slowly we move towards focusing on building strong foundation of academic concepts at this age, so they do not have to revisit topics repeatedly.
- We have observed that children in their later years often struggle with basics which then hinder in keeping up with the heavy syllabus.
- During this period, children have maximum energy and no major responsibilities which exhausts them. So, we focus more on teaching them how to sit with the hard & boring stuff and make it interesting for themselves.

© Curious Team Learning Pvt. Ltd.

When they work on different things, sit with problems, and re-do the steps to understand the problems, it instills the skill of resilience and being patient with solving problems.

- From this age we teach them 'thought experiments' which expand their imagination and build creative thinking so they can invest their remaining time in imagining, creating, and innovating rather than looking for distractions.
- Creating gives them a medium to channelize their energy and curiosity.
  This not only helps them choose their own inner world of thoughts and ideas but also encourages them to choose creating over consumption.
- We encourage self-exploration, pursuing different hobbies, experimenting a lot of things while building the understanding of the basics of different skillsets like coding, robotics, graphic design, gaming, 3D modelling, art etc. with us.
- This process builds their individuality so that they do not feel the need to fit in or dissociate but rather become comfortable with themselves and take their time to know how to search for answers to their questions.
- We also introduce 'Collaborative learning sessions' during this age group so they learn to communicate & work with others on larger projects, putting their problem-solving skills to use in their real lives.
- Exploring hobbies comes with a cost i.e., they are expensive & cost money.
  So, it becomes our responsibility to teach them the value of it, which is part of the financial literacy that we provide with regular classes.
- Financial literacy doesn't end with teaching budgeting and how money works in the real-world market. Most of it starts with economics, civics and history; their academic curriculum.
  Through this they learn, how money is directly related to values we humans generate & how many people have sacrificed themselves in past to make that value reach every citizen as money.
- They will not only learn to value money but will also be able to understand and figure out the true value on their own & how to create money.
  This enables them to understand the changes they will see in tax system and ever-changing investment strategies throughout their lifetime.
- As learning is the major goal and children have the time and space to try and fail, this practice teaches them to understand that failure is a part of learning something new. They learn how to deal with failure and do not fear retakes.
- This complete process builds their skillset to approach life with compassion towards themselves rather than judging or criticizing themselves for not knowing something, not being perfect on the first try or fearing to trying something new for the first time.

© Curious Team Learning Pvt. Ltd.

[Age Group: 12 – 14] – Understanding themselves through Academics

- Adolescent years & hormonal changes tend to make the child irritated & frustrated.
  This increases their need to stay alone because they start to experience strong emotions and complex thoughts. While their brain is under development, it leaves them exhausted & drained. So, they need more rest and time for themselves.
- Unfortunately, the current traditional system takes away this time & parents often confuse it with dissociation. The system labels this child's need to stay **alone** as harmful for this age group.
- On the contrary, it is where their creativity lives & acts as a catalyzer to their growth & imagination but since they are unable to communicate and do not understand the changes they are experiencing, they often start feeling **lonely**.
- These are two different concepts: one can do wonders and other pushes them towards dissociation.
- Loneliness pushes children to either fit in where they don't belong or dissociate themselves from their loved ones, whereas, in reality, staying alone gives them time to process this transition and develop.
- This is where it becomes important for us, as a community, to step in & help them build their day & routine around it, so they do not feel lonely.
- When they sit alone, questions in their heads approach new heights.
  A very common pattern seen here is, what is hidden from the child, makes them more curious to search for its answer.
  We can safely say this is where the existential questions start arriving for a human; life, death and beyond.
- Our system is designed to accommodate this transition by helping them build processes, making it manageable & less daunting.
  Here, we establish the connection between what they are experiencing & their academics. From adolescence to existential questions, we show them how they can find the true depth of their questions in their academic curriculum.
- Our guided 'sit with self' sessions, apart from their classes help children learn to listen to their inner voice and to drown out the external noise.
  This helps them build a sense of self and they start finding answers to who they are.
- They 'sit with self' to understand what is going on with their bodies, the life processes, and sit with the bigger questions that are coming to them instead of running away or finding distractions to avoid them.
  This practice creates calmness within them & teaches how to sit through discomfort.
- Learning to sit with themselves not only helps them in understanding how to deal with loneliness but also in becoming an independent learner.

© Curious Team Learning Pvt. Ltd.

- When they learn to understand their feelings, these answers come to them from within. This shows them their capabilities, the areas they need to work on, how to peel away the default societal conditioning and recognize the patterns they have slowly started building.
- Their questions often act as their compass, giving them direction towards finding their field/degree/subjects of their choice. This process gives the clarity & the ability to make life altering decisions.
- Here, we prepare them to not just learn about the present world but rather being able to adapt and understand the ever-changing world.

Academic skills acquired:

- Financial Literacy
- Learning Agility as a skillset.
- Able to structure their thoughts on paper.
- Able to put their thoughts and feelings into words.
- Understanding why they should study each subject.
- Having basic curiosity and knowledge in each subject.
- Identifying the problem they are having in each subject.
- Having a supportive nature to help other students facing academic problems.

What is your role in this as a parent?

[Age Group: 7 – 11] – Help them interact & engage with the real world

- In this age, we recommend parents to assign them responsibilities and allow them to make mistakes but also hold them accountable instead of blaming or scolding them. Sentences like ‘you can’t do one thing right’ or ‘you are good for nothing’ build low self-esteem rather than teaching them to learn and improve.
- As they are in the process of figuring out a lot of things, you will also need to trust the process and learn how to respect their choices. Being direct, clear in your instructions instead of constantly nagging will help you build a better relationship with them in the long term.
- The goal is to help parents and children to be able to make time for each other just to connect in a space where parents do not worry about the child’s future and the child does not think that the parent will ask them to study as soon as they see them.
- You need to understand that during this age they are exploring and not everything needs to have a ‘future scope’ to try or have interest in.
- Showing interest in their hobbies, learning about what interests them without passing comments or judgement or making unnecessary conclusions is a great way to connect

© Curious Team Learning Pvt. Ltd.

with them. This gives them space to open up and allows you to know more about them and their thoughts.

- Children often get quite excited about the new things they try.
  They like to talk about the new hobbies, ideas & thoughts they are exploring.
  You can validate them by listening more, rather than responding by labels like 'good' or 'bad'.
- During this age, they like to become more involved in the real world.
  So, you can take them to bank visits, show how things work in real world etc.

[Age Group: 12 – 14] – Giving them their personal space

- During adolescent years, it becomes important for parents to give them time and space to learn and understand how to be themselves.
  Being patient during this time solves most of the conflicts instead of taking things personally.
- Since they start questioning authority, they will question you, your life choices, your daily habits. They will observe your daily life & how you interact with the real world.
- They will start taking your relationship with them more seriously and feel strong emotions towards you. This will shape how they will have future relationships or how they will build their future life. So, it becomes important for you to become the healthier & better version of yourself if you wish to set an example for them.
- Most often when children come across unpredictable behavior & moods of their parents, they internalize them. Everything you do or say, shapes the way they learn to see themselves in future. It becomes their inner voice & determines how they navigate their future life decisions.
- As they like to be more alone & in their own space, it often backfires if they are forced to be in spaces they are not comfortable being, among people they do not want to be with. So, it's okay to leave them be but it is also necessary to be available for them whenever they come out of isolation, even for a little time. We need to leave them alone but do not make them feel lonely because if we do, they will listen to someone who will tell them "You are not alone" before us.
- The more you will stop them or have strong opinions about what they do, it will make them push you away. Instead of making assumptions, you can get to know about them & talk to them about it otherwise they will learn to lie to you.
- Your role isn't to become their best friend because it will make them question your authority. So, here the concept of boundaries works well.
  Setting boundaries with them is part of building a healthy relationship with them.
  Clear, mindful boundaries of what is tolerated and what isn't, gives them a sense of predictability and what to expect.

© Curious Team Learning Pvt. Ltd.

Respecting their space, and their boundaries helps them build trust in you.
Giving them space & letting them come to you, instead of you chasing them or forcing them to talk to you will create gaps rather than building connection.

- You can connect over cooking, sharing different household responsibilities, talking about your life experiences, your hobbies & interests. This gives the child a glimpse into your life instead of seeing it as you having it all together as the emotions of self-doubts, questioning oneself start to emerge during this age.
- As a parents it is important for you to understand that they are struggling and going through changes in their life and nothing they say or do is a personal attack but rather their need for connection and wanting to be understood.

What changes will you see?

- Empathy
- A stronger sense of identity.
- Clarity on concepts, and skillsets, and the problems and questions they worked on with us.

Q Why our '7 – Year Program Plan' is recommended before '4 – Year Program Plan'?

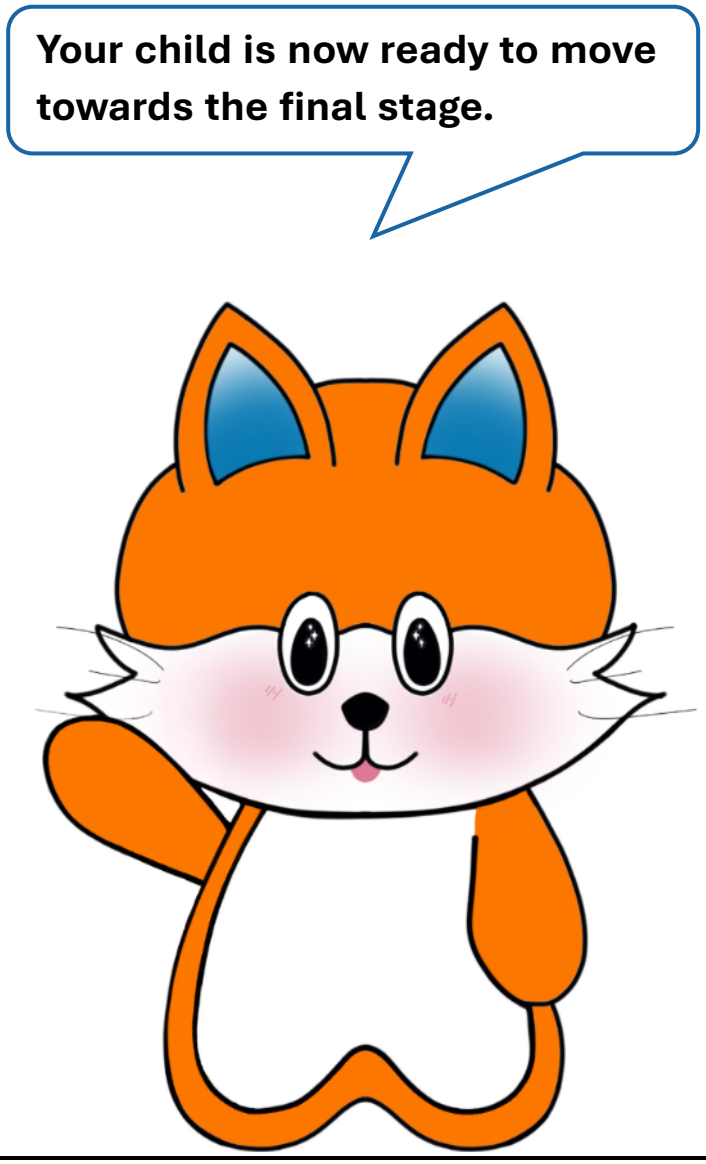

By the end of our 7- year program children become capable of handling responsibilities; become resilient and learn how to build healthy relationships.
They understand about respect, become empathetic, know people around them, and their self-worth.

When children grow older, they start feeling exhausted and burnt out because the syllabus escalates and academics become content heavy & dense, theoretically and practically, while also juggling the real world & societal expectations, simultaneously.

If their basics and foundation aren't strong and concrete, then they won't be able to navigate the real world and their academic learning efficiently.

This pushes them more towards avoidance, procrastination and distracting themselves. Resulting in them consuming knowledge from social media rather than books. This influences them towards following any path which may or may not turn out to be harmful for them but might have severe consequences.

The 4 – Year Program

For Child & Parent

TOTAL INVESTMENT: ₹7,04,411.00 PER ANNUM.

AGE: 15 – 19 yrs.

At this age, the consequences of the past start to show in their lives.
For the first time, they will experience how past actions have an impact, why you should plan for the future, what can happen if you won't. This is also when responsibilities start to come to them and they go through lot of changes in their lives. Studying gets more serious; they have decisions to make and are now old enough to understand the world.

- Career Planning.
- Learn to take on responsibilities.
- Independence in basic survival skills and household chores.

The behavior you observe will be:

- Self-doubt.
- Fear of messing up their future.
- Wanting to build their future on their own.
- Not trusting what they have done all these years.
- Being underconfident and overconfident simultaneously.
- Feeling no one understands them, especially their parents.
- Need to build a real relationship with someone of their age which can be of any type like friend, partner, or competitor.

How do we work?

- In this age, our role is to work with them as a mentor and guide.
  We teach the child how to take decisions, the pros and cons of it and how it impacts their own and the life of others around them. This teaches them mindful and intentional decision – making skills.
- Their curriculum introduces challenging concepts, which make them question everything they have learnt till now.
- As they get introduced to topics like atoms, molecules it brings the conversation about the universe as a whole and what is the role of every particle.
- They learn how they are a small particle of it, and how they exist as a complete ecosystem and how even as an individual, they are dependent on others and how others are dependent on them.

© Curious Team Learning Pvt. Ltd.

- This teaches them about impact, their responsibilities and how their life holds importance.
- They get introduced in detail about the conflicts the world has been through, and how many people sacrificed their lives so the future generations could have the basic rights they have today.
- This teaches them how to make mindful choices and decisions, how they want to lead and build their life as an adult.
- The strong foundation we worked to build during their 7-14 years now helps them to dive deep into the subjects, question what they are studying and learn to build a belief system about the world.
- Their critical thinking comes into full force as their academics make them question the society and how everything works.
- This is when they come to understand the importance of building individuality during the early years. They learn how to hold questions and how to reach their answers on their own. We work with them to help them become independent learners, a skillset needed in later years of life.
- When they learn how their existence and the choices they are able to make today are a work of someone else. How they are connected to the universe and how everything exists within them; every answer, every path. This builds a sense of empathy in them.
- Our goal here is to enlighten them with their newfound depths of empathy by putting them in different shoes and gain perspective.
  We make them experience the different realties of others. This helps them understand how their teachers have been teaching them yet i.e., understanding their problems and queries by going down to their level of knowledge level. A skill that develops empathy and perspective.
- They become capable of understanding perspectives of their parents, grandparents, and others. Why someone made the certain choices they did in life and how to expand themselves to hold conflicting thoughts, feelings and decisions together.
  They learn to accept how different perspectives and opinions can be right at the same time and how the world doesn't work in black and white. It's a skill with which most adults struggle with today.
- They learn to makes choices worth making an impact in the world.
  Their thoughts become specific, they gain a clear sense of identity, morality and ethics.
- Now, everything they have learnt, create, imagine hold meaning.
  Their skillset have a purpose and sense of direction.
- They are now capable of choosing any career path they wish to.
  Their basics are strong and they understand the importance of each work and what

© Curious Team Learning Pvt. Ltd.

building a career truly means. They hold answers and a pathway to find answers to their questions.

- When they choose their career path, irrespective of the subject, they experience the depth of the subject. This builds their understanding of how no subject is superior than the other but rather works in harmony with each other. That each subject holds the depth they have experienced irrespective of their choice.
- This prepares them for the challenges they choose to pursue in future.
  Their strong basics allow them to pursue any goal with ease, as they now understand the depth they need to work on for that task, how to calculate risk and increase their probability of achieving it. This is a necessary skillset of a good researcher required in the world of AI.
- They know how to sit with a problem and how to reach to the answer through the process they have learnt in the past.
- Our job doesn't end here where they have figured out their career path.
  Career is a starting point, which leads to many different changes in the trajectory of their life. This age is the beginning of the changes in relationship they have with their parents, friends and others.
  Life doesn't just test their confidence and gives consequences of past, it also tests the strength of relationships they have built. They learn to let go of relationships which do not align with them, who stays, who supports them in their hardest time and who they can trust.
- And our work is to make sure that you as a parent stay on their good side because often times when children lose trust of their parents, they trust the person who listens to their doubts and suggests that you might the reason of their doubts.

Academic skills acquired:

- Ability to learn independently.
- Have deep understanding of subjects.
- Clarity on how to make career choices & decisions.
- Clarity on competitive exam preparations and future goals.

What is your role in this as a parent?

- The most important role as a parent you have here is to become available to listen to them. They should feel comfortable to come and talk about anything to you.
- At this age, life is already making them feel accountable for everything, your words will only add fire to it. This is why it is important for them to know that you are with them in everything. They will be losing friends, going through emotional hurt because of actions of people around them.

© Curious Team Learning Pvt. Ltd.

Make sure they can talk to you about it. Your goal here is to listen instead of telling them what they did was right or wrong.

- As a parent when you feel like you want to tell them that they are wrong, start talking with why you feel they are wrong instead of giving it as a judgement. A very nice addition would be a story of your past which you experienced which is making you give this judgement.
- Do not be afraid to be vulnerable around your child. They are becoming adult and their brain is developed to understand complex emotions. You will be amazed by how good this can make you feel and they may even teach you a thing or two here.
  Do not feel small in learning from them.
- Let them choose you, instead of imposing yourself on them. This choice will go a long way.

What changes will you see?

- Hobbies:
  - To build mind.
  - To self-express.
  - To keep them healthy.
- Highly Perceptive.
- Confident in talking to others.
- Passionate and goal – oriented.
- Know how to build relationships that last.
- Rooted in their self-worth and self-esteem.
- Clarity on subjects and career they want to have.
- Have mindful decision making and problem-solving skills.
- The child becomes an independent learner and capable of building their own healthy study routine.

Q How this level of academics learning helps the individual?

Below are some questions and subjects where the answers lie:

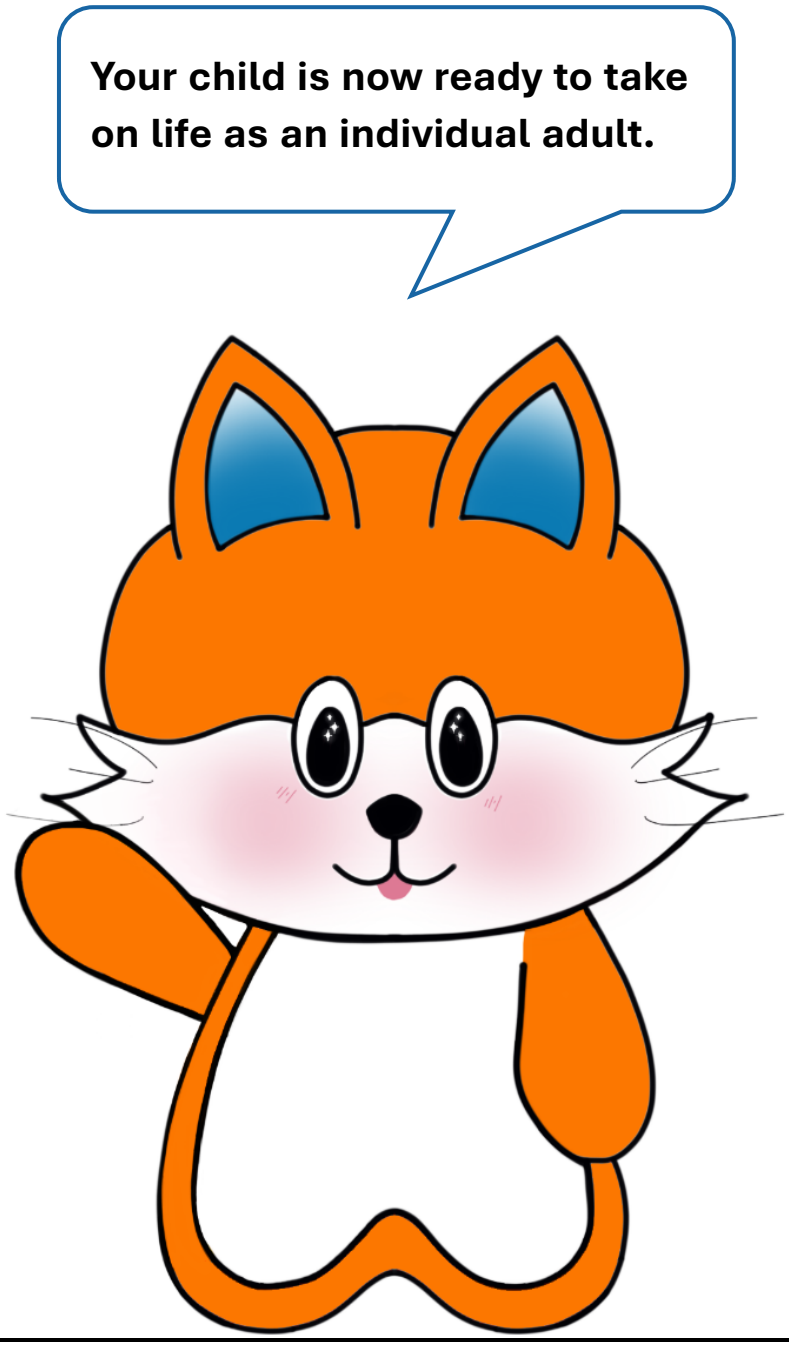

- How this universe exists? Physics, chemistry and maths
- Why this universe exists? Biology, Chemistry and history
- What is their role in this world? Art, Craft, History, Civics
- How our world works? History, Civics, Geography, Maths
- How world economics works? Civics, Economics, Maths.
- Why life builds relationships? History, Biology, Chemistry, Physics, Art
- What is the purpose of life? Biology, Civics, Economics, Maths, Geography, History, Chemistry, Physics (Yeah, basically all)

These subjects are perfectly curated to answer everything.
These are some of the deep questions that the academics answers but helping children navigate it is the role of the teacher.
That is why our teachers understand the deep basics of all these subjects so they can help the child navigate answers beyond basic understanding.

These questions come to every human when they sit alone but our busy life keeps us away from these real questions.
These types of questions are the foundations of most popular companies, noble prized researches, theories of scientists like Einstein, arts of most popular painters, musicians and more.

Understanding and finding the answer to these not only helps mentally, but also creates a great advantage at coping up with the everchanging world. Because if someone understands the whole universe, and not just understands but to such extent that now these answers live in their instincts. They have now skills to extract knowledge to carve an entire universe on their own. How little this world would be for such person to navigate a healthy and wealthy life? You can imagine yourself.

Frequently Asked Questions [FAQs]

Q Will my child get isolated from everyone?

No, absolutely not.
Developing a strong sense of self does not distance a child from parents, grandparents, or their community. Children with strong identities don't reject others; they are actually better equipped to listen, empathize, and handle opposing viewpoints without feeling attacked. When we equip children to navigate the world independently instead of overprotecting them, they build healthier, more genuine relationships with the people around them.
Having strong personal opinions doesn't mean a child can't understand or respect different perspectives. In fact, people who lack a firm sense of self are often the ones who feel threatened by differing views or get swept away by peer pressure.

True individuality means having a grounded set of values, morals, and beliefs. This protects children from being manipulated, brainwashing and blind conformity, allowing them to navigate the world with clarity.

Q Will my child forget his culture or his traditional family background?

Quite the opposite. Learning to navigate the world as an individual does not mean severing ties with where they come from. Instead, it transforms traditional practices from mindless routines into intentional, meaningful efforts.

Yes, an educated child might ask '*why*' certain customs are practiced but asking questions is not a rejection of culture. When children understand the roots, history, and purpose behind their traditions, they develop a genuine respect for them, choosing to honour their heritage out of love and mindfulness rather than fear.

Q Does giving a child-centred learning will impact how they will live with others? Will they stop acknowledging and accepting others' opinions and belief system?

Not at all. There is a common fear that focusing on the individual creates entitlement, but the reality is the exact opposite. When a child is raised in an environment that validates their thoughts and feelings, their capacity for empathy expands. They don't feel the need to be defensive about their own beliefs, which allows them to truly listen and accept others. This curiosity about different perspectives allows them to form relationships rooted in genuine mutual respect, understanding, and loyalty.
